

## CROWD BARRIERS PLUS 110 CM

The new model is an upgrade of the basic crowd barrier released in the past years. The Crowd Barrier PLUS is 1,10 m wide: this way the user would need to buy less items to reach a certain final dimension and 1,10 m is thought to precisely fulfil the space of a truck.

The Crowd Barrier PLUS model is totally aluminium made. In this way the components are all welded. What does this mean? There are no more rivets in the structure, this means that the barrier is much more strong and stable. The front net is also welded, this makes less noise when you move the barrier and produces less dangers for people's fingers. The structural profiles are larger and thicker, for a higher resistance.

This is a product for big events. **Keywords are safety, strength and money saving!**

	FIGURES
OPEN BARRIER DIMENSIONS	1100 x 1250 x 1205 mm
WEIGHT	36 kg
LOADING CAPACITY	500 kg
CLOSED BARRIER DIMENSIONS	1100 x 1315 x 110 mm

End ramp available on request.

## CROWD BARRIERS

TRABES Aluminium Crowd Barriers aim at providing a safe control system on crowd during all kinds of event, concerts and outside shows in general. Crowd barriers are the right balance between safety and comfortable systems for both the event audience and backstage technicians. TRABES Crowd barriers, in alluminium, are very simple and easy to assemble, and even easier to store, thanks to the light and folding structure. The assembly system, very simple too, allows the user a fast installing operation. One needs a very simple wrench to connect more units, through the coupling system which is made of a quick pin with bolt, for connection, and a spigot, to ensure the system stability on the ground. TRABES Crowd Barriers are of course linear, angular and gate version for cables and backstage technicians to cross them.

TRABES Gate barrier is designed to provide the user with a cable/people cross barrier. Featured with a double safety system, Gate is the ideal item for providing access to the stage through the barriers line. It is also safe during the event with its door opening towards the audience. The gate barrier, as the other linear barriers, is provided with a new system to cope with the unevenness of the ground, which is typical for outdoor events.
